                                                                                                                                                                                                                                                 The invention relates to a derivative or variant of human tropoelastin (hTE) having elastin-like and/or macromolecule (specifically glycosaminoglycan (GAG))-binding properties. Cells contraining vectors comprising the nucleic acids encoding the variants or derivatives are used to produce the proteins recombinantly. The tropoelastin derivatives or hybrid proteins containing the derivatives are useful in medical, pharmaceutical, veterinary and cosmetic applications, e.g. as antiproducts. The hybrid protein have controllable GAG-binding properties, depending on presence or absence of a specific fragment, designated peptide 26A, from hTE. The present sequence represents a human tropoelastin derivative SHELGamma excluding the product encoded by exon

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention comprises the amino acid and coding sequences of novel proteins. The DNA and protein sequences of the invention are useful as: markers for tissues in which the corresponding protein is preferentially expressed, as molecular weight markers on gels; as chromosome markers or tags; to identify chromosomes or to map related gene positions, and to compare with endogenous DNA sequences in patients to identify potential genetic disorders. The present amino acid sequence represents a protein
                                                                                                                                                                                                                                                                                                                                                                                                           analysis, characterization or therapeutic use, or as markers for tissues in which the corresponding protein is preferentially expressed.
                                                                                                                                                                                                                                                                                                                                                                                             New polynucleotides, useful for expressing recombinant proteins for

                                                                                                                                                                                                                                                                                                                                contested the susceptibility to proteolysis is reduced or eliminated, or a subsequence has been inserted so that susceptibility to proteolysis is conceased. The derivatives have with reduced susceptibility, and can be increased. The derivatives have with reduced susceptibility, and can be concerned to used where the wild-type protein would be degraded too easily, e.g. in contact with serum or wound exudate. The tropoelastin derivatives provide competitive inhibition of protease activity. The tropoelastin derivative provide competitive inhibition of protease activity. The tropoelastin derivative derived protease-susceptibility sites, are useful for proliferation.

The derivatives, and other polypeptides containing tropoelastin derivative and for inducing chemical for and for inducing chemicals. They are also useful for proliferation or growth inhibition, particularly of smooth muscle cells, epithelial or conductive inducing the protease cleavage site in tropoelastin cells, fibroblasts, osteocytes, chondrocytes and platelets. Peptidomimetics that mimic the protease cleavage site in tropoelastin controlling localized growth of cancers or metastases, or to limit controlling localized growth of cancers or metastases, or to limit controlling localized growth of cancers or metastases, or to limit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              156

It can be used to produce tropoelastin which is a precursor of elastin which does not have desmosine, isodesmosine and lysynoyllensine residues and isn't cross-linked. (Updated on 25-MAR-2003 to correct PA field.) (Updated on 24-OCT-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Region
                                                                                                                                                                RESULT
                                                                                                                                                                                                                                                  g
                                                 à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      the invention discusses a composation comprising two or more isolated rate or human polymucolectides or a polymucleotide which represents a fragment, derivative or allelic variation of the mucleic acid sequence. Also calaimed are a vector comprising the novel polymucleotide, a host cell which is differentially regulated in an animal subjected to pain and a that increases or decreases the expression of the polymucleotide sequence that increases or decreases the expression of the polymucleotide sequence that is differentially expressed in neuronal tissue of a first animal compound that is differentially expressed in neuronal tissue of a first animal compound that regulates the activity of one or more of the expression of a polymucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the composition of one or more of the polymucleotides, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more of the compound that compound that regulates its activity is useful for preparing a medicament for treating pain and a pharmaceutical composition comprising the one or more of the sequence presented is a rat protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note: the sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at the compound composition com

This invention relates to nucleic acid sequences AAF93744 - AAF93916 which encode human secretory or membrane proteins represented by AAB88317 - AAB88419. Included in the invention are primers AAF93917 - AAF94295 and AAF62232 - AAF62235 which are used to isolate the cDNA sequences of the invention. The invention also includes methods for the production of antibodies directed against the proteins, and cDNA sequences, which can be used in vaccines. The polynucleotide sequences can be used in gene therapy. The polynucleotide sequences and the proteins they encode may be
                                                                                                                                                                                                                                                                                                                               GAGGLGAGVGVVGFTFPGGVGGQLGFGGKPPKTYGGALGALGFRGGVGCAQGKYCG 290

used in the prevention, treatment and diagnosis of diseases associated with inappropriate secretory protein/membrane protein expression. The nucleic acids and complementary sequences may also be used as DNA probes in diagnostic assays (e.g. polymerase chain reactions (PCR)) to detect and quantitate the presence of similar nucleic acid sequences in samples. They may also be used to study the expression and function of secretory proteins/membrane polypeptides and their role in metabolism. The proteins/membrane polypeptides antigens in the production of antibodies against them and in assays to identify modulators (agonists and antagonists) of expression and activity. The antibodies and antagonists may also be used as therapeutic agents to down regulate expression and activity. The antibodies and antagonists activity. The antibodies and also be used as therapeutic agents to used as diagnostic agents for activity. The antibodies and also be used as diagnostic agents for detecting the presence of the polypeptides in samples (e.g. by enzyme linked immunosorbant assay (ELISA). Examples of diseases which may be treated include rheumatoid arthritis and diabetes

GENERAL INFORMATION:

APPLICANT: PROTEIN SPECIALITES LTD.

APPLICANT: HSC RESEARCH AND DEVELOPMENT LIMITED PARTNERSHIP

TITLE OF INVENTION: SELF-ALIGNING PEPTIDES MODELED ON HUMAN ELASTIN AND

TITLE OF INVENTION: OTHER FIBROUS PROTEINS

FILE REFERENCE: 041082/0112

CURRENT FILING DATE: 2003-05-08

PRIOR APPLICATION NUMBER: 09/340,/36

PRIOR PLLICATION NUMBER: 09/340,/36

NUMBER OF SEQ ID NOS: 11

SEQ ID NO: 11

SEQ ID NO: 2.1

"Isolated supravalvular aortic stenosis: functional haploinsufficiency
of the elastin gene as a result of nonsense-mediated decay.";
of the elastin gene as a result of nonsense-mediated decay.";
-!- FUNCTION: Major structural protein of tissues such as aorta and
nuchal ligament, which must expand rapidly and recover completely.
-!- SUBGUILLIA is polymeric elastin chains are cross-linked together
into an extensible 3D network.
-!- SUBCELLULAR LOCATION: Extracellular matrix of elastic fibers.
-!- ALTERNATIVE PRODUCTS:

DISEASE: Defects in BLN are a cause of autosomal dominant cutis laxa [MIM:123700]. Cutis laxa is a rare connective tissue disorder characterized by loose, hyperextensible skin with decreased characterized by loose, hyperextensible skin with decreased resilience and elasticity leading to a premature aged appearance. The skin changes are often accompanied by extracutaneous manifestations, including pulmonary emphysema, bladder diverticula, pulmonary artery stenosis and pyloric stenosis. DISEASE: Haploinsufficiency of ELN may be the cause of certain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             TIŠSUB=Hippocampus, and Placenta;

                                Williams-Beuren syndrome (WBS) [MIM:194050]. WBS is a rare developmental disorder and a contiguous gene deletion syndrome involving genes from chromosome band 7q11.23.

DISEASE: Defects in ELN are the cause of supravalvular aortic stenoeis (SYAS) [MIM:48550] SYAS is a congenital narrowing of the ascending aorta which can occur sporadically, as an autosomal dominant condition, or as one component of Williams-Beuren
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       GO; GO:0005578; C:extracellular matrix; TAS.

"The cysteine residues in the carboxy terminal domain of tropoelastin form an intrachain disulfide bond that stabilizes a loop structure and positively charged pocket.";
                                                                                                                                           Biochem. Biophys. Res. Commun. 186:549-555(1992).
-!- FUNCTION: Major Structural protein of tissues such as aorta and nuchal ligament, which must expand rapidly and recover completely.
-!- SUBUNIT: The polymeric elastin chains are cross-linked together into an extensible 3D network.
-!- SUBCELLULAR LOCATION: Extracellular matrix of elastic fibers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     /FIId=VSP 004240.

"Rat tropoclastin is synthesized from a 3.5-kilobase mRNA.";

J. Biol. Chem. 263:13504-13507(1988).

-! FUNCTION: Major structural protein of tissues such as aorta and nuchal ligament, which must expand rapidly and recover completely.

-! SUBUNIT: The polymeric elastin chains are cross-linked together into an extensible 3D network.

-! SUBCELLULAR LOCATION: Extracellular matrix of elastic fibers.
-! ALTERNATIVE PRODUCTS:

-!- FUNCTION: Major structural protein of tissues such as aorta and nuchal ligament, which must expand rapidly and recover completely.
-!- SUBUNIT: The polyweric elastin chains are cross-linked together into an extensible 3D network.
-!- SUBCELLULAR LOCATION: Extracellular matrix of elastic fibers.
-!- ALTERNATIVE PRODUCTS:

Biophys. 241:684-691(1985).

Arch Biochem. Biophys. 241:684-691(1985).

-i- FUNCTION: Major structural protein of tissues such as aorta and nuchal ligament, which must expand rapidly and recover completel.

-i- SUBUNIT: The polymeric elastin chains are cross-linked together into an extensible 3D network.

-i- SUBCELLULAR LOCATION: Extracellular matrix of elastic fibers.

-i- PTM: The crosslinks are made of deaminated Lys.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;
